J. Microbiol. 43:315-321(1997).

-i. CATALYTIC ACTIVITY: HYALURONATE = N 3-(4-DEOXY-BETA-D-GLUC-4-I-GARLYTIC ACTIVITY: HYALURONATE = N 3-(4-DEOXY-BETA-D-GLUC-4-I-GRUGONOSYL)-N-ACETYL-D-GLUCOSAMINE.

-i. SUBBUIT: MONOMER.
-i. SUBCELLUIAR LOCATION: CELL-ASSOCIATED.
-i. SUBCELLUIAR LOCATION: CELL-ASSOCIATED.
-i. SIMILARITY: BELONGS TO THE POLYSACCHARIDE LYASE FAMILY 8.
-i- FUNCTION: FUNCTIONS IN THE LET-60 RAS SIGNALING PATHWAY; ACTS DOWNSTREAM OF LET-60 DURING C.ELEGANS VULVAL INDUCTION.
-i- DEVELOPMENTAL STAGE: HIGHEST LEVELS IN EMBRYOS AND LARVAE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2. /SIDSB/gcgdata/geneseq/geneseqp/AA1980.DAT:*

```
This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents,
                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Linear; tachyplesin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier.
                                                                                    This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridges. The newel derivatives are used to deliver active agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to new antimicrobial peptides which correspond to amino acid sequences in the transmembrane proteins of lentiviruses, in particular HYV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high tructural amphipathicity and hydropholic moment. Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to marcroorganisms (bacteria, fungi, viruses and protozoa) but significantly is demonstrated against Gram positive and negative bacteria including pseudomonsa seruginosa, Staphylococcus aureus, Enterococcus faecalis and presents and precoccus faecalis and
                                                                                                                                                       0;
antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                            Antimicrobial; transmembrane protein; TM; lentivirus lytic peptide; LLP; SLP; amphipathic; antibacterial; antifungal; antiviral; antiprotozoal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is one of 169 disclosed specific examples of the present sequence. It is an analogue of the peptide designated SLP1 (see AAW47616) which is a peptide from the transmembrane protein of
                                                                                                                                                       Gaps

The invention relates to new antimicrobial peptides which correspond to amino acid sequences in the transmembrane proteins of lentiviruses, in particular HIV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high amphipathicity and hydrophobic moment. Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly is demonstrated against Gram positive and negative bacteria including Pseudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an antimicrobial peptide of the invention, and used for treating infections caused by Staphylococcus aureus.

C used for treating infections caused by Staphylococcus aureus.

C methicillin resistant s. aureus, Pseudomonas aeruginosa, Enterococcus faecalis, S. marcescens Escherichia coli, fungi, protozoa and viruses in acrocoganisms such as bacteria, fungi, protozoa and viruses in acrocoganisms such as bacteria, fungi, protozoa and viruses in acrocoganisms such as production of intibit unwanted microbial growth, particularly for the production of recombinant proteins or vectors for gene therapy. They can also be used in preventing infections through the trainisation of wounds prior to suture and to sterilise surgical instruments. The unique structure of these antimicrobial peptides inparts high potency while selectivity is maintained, they are concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing it more difficult for a microorganism to develop a mechanism of testistance against this type of antiblotic. Their small size makes them relatively simple to prepare by standard synthetic peptide chemistry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

```
methicillin resistant S. unaced. Pseudomonas acruginosa, Enterococcus faccalis, S. marcescens, Escherichia coli, fungi, protozoa and viruses in amammalian host. They can be used to inhibit growth of diverse microorganisms such as bacteria, fungi, protozoa and bNa and kNa viruses of microorganisms such as bacteria, fungi, protozoa and bNa and kNa viruses and can be used in tissue culture to inhibit unwanted microbial growth, particularly for the production of recombinant proteins or vectors for gene therapy. They can also be used in preventing infections through the sterilisation of wounds prior to suture and to sterilise surgical instruments. The unique structure of these antimicrobial peptides imparts high potency while selectivity is maintained, they are moderately haemolytic but only lyse red blood cells at high concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing little selectivity. The peptides target a membrane structure which makes it may be added to a mechanism of resistance against this type of antibiotic. Their small size makes them resistance against this type of antibiotic. Their small size makes them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

(HYSE-) HYSEQ INC

Novel nucleic acids and polypeptides, useful for treating disorders

such as central nervous system injuries

WPI; 2001-442253/47. N-PSDB; AAI60454.

                                                                                                                              in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotide sequences AAC79348-C79375 encode plant viral movement proteins AAB4494-B44520. Some plant viruses have been shown to be able to establish systemic infections via movement proteins that utilise existing plant pathways to traffic macromolecules to surrounding cells. Proteins such as those of the invention are similar to viral movement proteins are useful for obtaining a nucleic acid fragment encoding a viral movement protein. Polynucleotides cell: The plant viral movement proteins are useful for obtaining a nucleic acid fragment encoding a viral movement protein. Polynucleotides cenceding the plant viral movement proteins are useful in the field of plant molecular biology, and in the preparation of antibodies against the proteins. The proteins are also useful in the field of proteins. The proteins from the same or other plant species, and to create transgenic plants in which the protein is presented at higher or lower levels than normally found. The proteins and nucleotide sequences may be used to control cosuppression and engineer plant virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä

ö The invention relates to new antimicrobial peptides which correspond to particular HIV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high amplicational analogues and homologues of these peptides are structural and furcional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly is demonstrated against Gram positive and negative bacteria including Pseudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and Antimicrobial peptide; LLP1; SLP-1; LLP2; SLP2A; SLP2B; ELP; infection; growth inhibitor; microorganism; virus; gene therapy; vector production; sterilisation. Gaps The present sequence is one of 169 disclosed specific examples of the new peptides. It is an analogue of the peptide designated SLP1 (see AAW47616) which is a peptide from the transmembrane protein of SIV strain MM239. ő Score 44; DB 19; Length 27; Pred. No. 3; 1; Mismatches 4; Indels Retroviral TM peptides - useful as antibacterial agents Disclosure; Column 10; 59pp; English. Antimicrobial peptide SLP-1 analogue. AAY32624 standard; peptide; 27 AA. Simian immunodeficiency virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY84945
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δλ
 This sequence represents an antimicrobial peptide of the invention, and is an analogue of the peptide SIP-1 (see AAY2551). The peptides can be used for treating infections caused by Staphylococcus aureus, used for treating infections caused by Staphylococcus aureus, used for treating infections. Peaudomonas aeruqinosa, Enterococcus faecalis, S. marcescens, Escherichia coli, fungi, protozoa and viruses in a mammalian host. They can be used to inhibit growth of diverse in cororganisms such as bacteria, fungi, protozoa and DNA and RNA viruses and can be used in tissue culture to inhibit unwanted microbial growth, particularly for the production of recombinant proteins or vectors for gene therapy. They can also be used in preventing infections through the sterilisation of wounds prior to suture and to sterilisas surgical instruments. The unique structure of these antimicrobial peptides instruments. The unique structure of these antimicrobial peptides instruments high potency while selectivity is maintained, they are concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing the moreorganism to develop a mechanism of the mesistance against this type of antibiotic. Their small size makes them concentratively simple to prepare by standard synthetic peptide chemistry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; primer; detection; diagnosis; antisense therapy; gene therapy.

The present invention describes primer sets for synthesising 5602
full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of
the 5602 nucleotide sequences defined in the specification, where the
complementary strand of a polynucleotides; or (b) a combination
complementary strand of a polynucleotides; or (b) a combination
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
complementary strand of a sequence is selected comprises a 5'-end
coligonucleotide which comprises a 3'-end sequence, where the
coligonucleotide comprises a 1'-end sequence, where the
coligonucleotide primers are useful for synthesising polynucleotides,
the specification. The primers are useful for synthesising polynucleotides,
che fall-length cDNAs. The primers are also useful for the
complementary without any specialised methods are also useful for the
complementary and an expecialised methods. And 1365 to AAH13632
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
complementary full-length cDNAs and a useful in the exemplification
conference and and a man amino acid sequences; and AAH13632 to AAH13632
complementary full-length cDNAs and a useful in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                    Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                The present sequence represents a murine cholesterol 25-hydroxylase polypeptide. The polypeptides and polynuclectides can be used to regulate cholesterol 25-hydroxylase activity and therefore serum cholesterol in a mammalian host. The polypeptides, polynucleotides and the cholesterol 25-hydroxylase-specific binding agents are useful in diagnosis (e.g. genetic hybridization screens for cholesterol 25-hydroxylase transcripts), therapy (e.g. cholesterol 25-hydroxylase inhibitors to modulate serum cholesterol) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating natural 25-hydroxylase genes and transcripts, reagents for screening chemical libraries for lead pharmacological agents).
                                                                                               New cholesterol 25-hydroxylase polypeptides, useful for regulating cholesterol 25-hydroxylase activity and therefore serum cholesterol in a mammallan host, have cholesterol 25-hydroxylase-specific structure
                                                                                                                                                                                                                                                                                                                                           Gaps

Sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala, Leu and Asp, respectively. Tachyplesin (AAX69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which halp to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y69612-AAX69614, AAX69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isolaucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being
AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hosmocyctes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia scleroticum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions

Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly less toxic to red blood cells and other normal mammalian cells. Activity is demonstrated against Gram positive and negative bacteria including pseudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to new antimicrobial peptides which correspond to
present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tackipplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic fand viruses. Note: The present sequence is not shown in the specification, but is derived from the generic tachyplesin analogue sequence given in column 23.
                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is one of 169 disclosed specific examples of the new peptides. It is an analogue of the peptide designated SLP1 (see AAW47616) which is a peptide from the transmembrane protein of
                                                                                                                                                                                                                                                                                             ;
